

# Accelerating Multi-Jurisdiction Competition Audit Review

**Lineal helped a multinational organization rapidly identify relevant materials across nine languages and seven countries using CAL-driven workflows in RelativityOne Germany.**

## CHALLENGE

The client needed to complete a competition law audit spanning seven European countries within a tight timeframe. The matter involved more than 8.5 million documents across nine languages, making traditional review approaches impractical. The audit required consistent, defensible relevance determinations across jurisdictions while complying with European data residency requirements.

## LINEAL'S SOLUTION

Lineal deployed an analytics-led, CAL-driven workflow designed specifically for multi-jurisdiction competition matters.

- Seven localized CAL queues tuned to regional and linguistic nuances, supported by a unified cross-jurisdiction model.
- Search term analysis, email threading, and de-duplication reduced the reviewable population from 8.6 million to 3.46 million documents.
- Prioritized relevance batches elevated high-value materials early, with diminishing return curves guiding defensible review stopping points.

## OUTCOME

The audit was completed on time while reviewing only a fraction of the total document population. The approach delivered defensible, regulator-ready results across seven jurisdictions and nine languages with minimal review effort.
